

MANICURING APPLIANCE

5

ABSTRACT OF THE DISCLOSURE

10

A manicuring appliance comprising a hand held center section with proximal and distal end sections each of which may be detachable from the center section. Each end section may have a lip shaped to bear against the base of the cuticle. The distal end section comprises a pusher for shaping the cuticle and prepare it for cutting by the proximal end section. The proximal end section includes a cutting blade positioned to properly cut or trim the cuticle along an arc which follows the arc of the cuticle base as the user moves the appliance along the cuticle. Various alternative embodiments of the proximal cutting section and distal pusher section are disclosed. In one such cutting embodiment, a safety barrier is positioned near the blade edge to limit the cutting depth.
